

# The best possible solution for your field of application

## **Cryptotickets enterprise edition**

### **Secure the benefits of Cloud applications for your business enterprise:**

The cryptotickets Enterprise Edition offers safety to all business enterprises which obtain web applications from the Cloud. Cryptotickets integrates all of the portals and applications which are already in use into the company's own specific identity and access management systems. In this manner, internal safety standards and guidelines are easily transferred to external applications. Thus, the company benefits from the efficiency of Cloud applications without taking unnecessary risks where security and safety are concerned.

## **Cryptotickets SaaS provider edition**

### **Convince your customers thanks to a high safety level:**

With the cryptotickets Service Provider Edition, providers of web applications in the Cloud secure access to systems which they make available to numerous clients using portals based on heterogeneous technologies. The cryptotickets system connects the Cloud applications to your customers' systems. The control of access takes place via the customers' own identity and access management systems. You as service provider thus provide your corporate clients with a convincing safety concept by which they regulate their staff members' access centrally and on a corporate level. At the same time you decrease the time and effort where administration is concerned. This is because administrative changes can be independently made by your customer, for example, whenever an employee is given new responsibilities.
